

a GRAFT growth: earlier placements condition every later choice

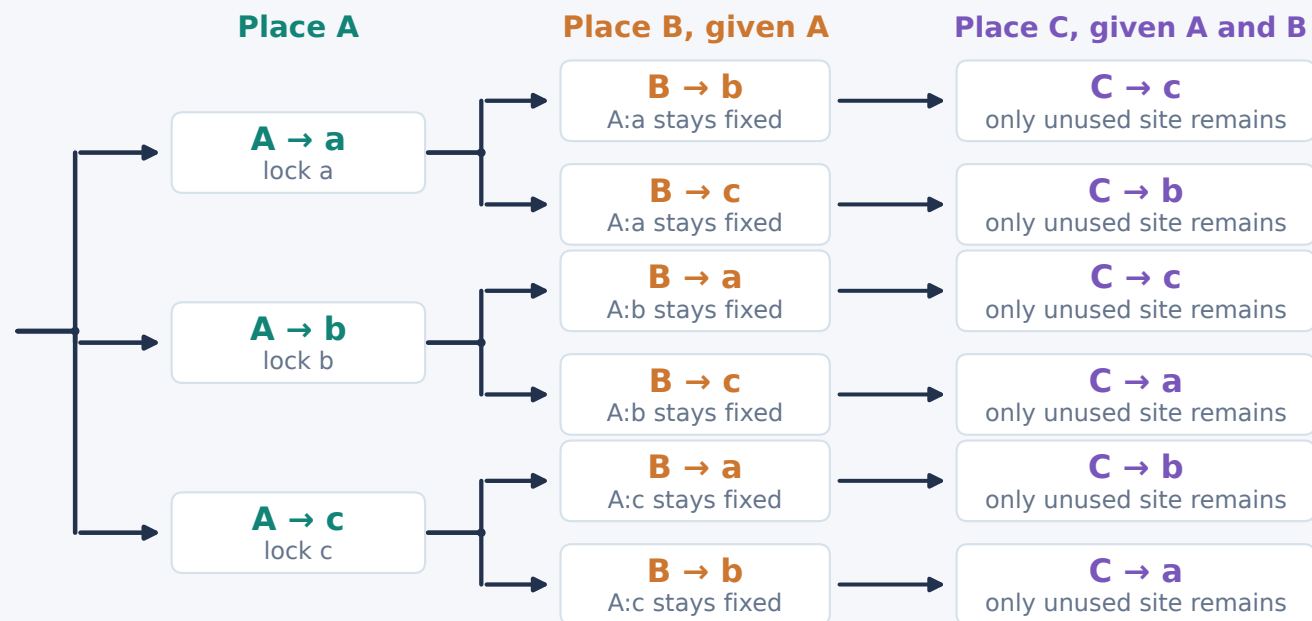

Local alcohol fragments A, B and C share this motif; R lies outside the matched atoms.

Three distinct target sites

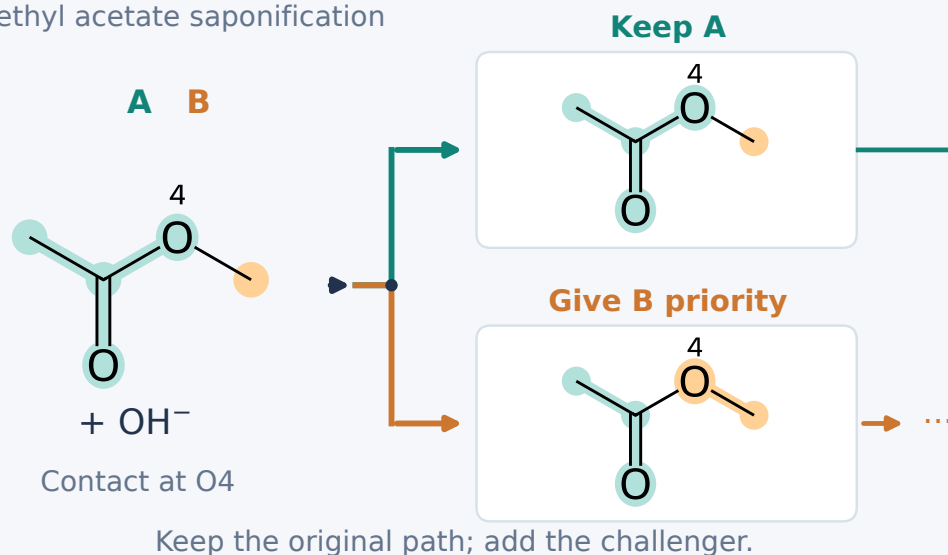

Each site preserves C-C, C-O and O-H.

Each path is a joint assignment; occupied target atoms cannot be reused.

b Add a branch when fragments compete

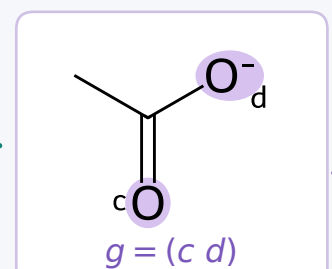

Methyl acetate saponification

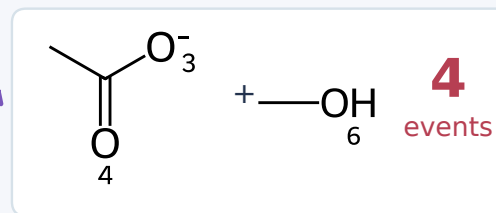

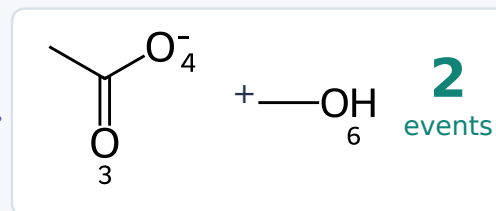

c Decode each compressed family

The oxygen exchange preserves matching at $\tau_{\text{iso}} = 1$

Matching symmetry

One branch
correlated alternatives

→ Search continuation

→ Event projection

Formal bond orders · heavy-atom events at $\delta = 0.5$
